

# DynaMesh<sup>®</sup>-IPST

## Special Prosthetic Mesh Implants for Stoma-Surgery

- 3-dimensional preshaped and seamless mesh
- Open-pore and elastic monofilament mesh
- Optimised for intraperitoneal placement by 2-component-textile structure (PVDF + PP)
- Optimum handling when performing open and laparoscopic techniques
- Minimal tissue traumatisation and maximum patient comfort

made

Germany

# DynaMesh®-IPST

**DynaMesh®-IPST** mesh implants are specially developed for the prevention of parastomal hernia in stoma-surgery. Thus **DynaMesh®-IPST** are used together with the formation of an artificial anus.

The one-piece, three-dimensional pre-shaped implant with its seamless transition into the intestinal cuff offers superb elasticity and flexibility at preparation of the stoma plasty. Optimal handling during open and laparoscopic surgery and minimal tissue traumatization with maximum patient comfort are guaranteed.

Being positioned intraperitoneally, the unique monofilament 2-component structure brings about ideal integration into the abdominal wall, a reduction in adhesions between the intestine and the mesh, and prophylaxis to prevent them. Due to its open-pore structure **DynaMesh®-IPST** further ensures high intra-operative transparency as well as liquid permeability in case of seroma or haematoma.

**Example:**  
Intraperitoneal mesh position ...

... with tack-fixation.

## Delivery program

### DynaMesh®-IPST

REF IP070215F1

Size: 15 cm x 15 cm x ø 2 cm

unit = 1 piece

REF IP070316F1

Size: 16 cm x 16 cm x ø 3 cm

unit = 1 piece

REF IP070417F1

Size: 17 cm x 17 cm x ø 4 cm

unit = 1 piece

REF IP070225F1

Size: 25 cm x 25 cm x ø 2 cm

unit = 1 piece

Delivery of special sizes upon request.
